Perinatal Hepatitis B Prevention Program (PHBPP)

Michigan Perinatal Hepatitis B Prevention Program Staff:

Manager:	Patricia Vranesich	517-335-8159	vranesichp@michigan.gov
Coordinator:	Pat Fineis	517-335-9443	fineisp@michigan.gov
Surveillance Specialist:	Kari Tapley	313-456-4431	tapleyk@michigan.gov
Case Manager/SE MI:	Sallie Pray	313-456-4432	prays@michigan.gov
Case Manager/Out-state:	Marcy Smith	517-335-8122	smithm7@michigan.gov

Mission: To identify hepatitis B surface antigen-positive (HBsAg-positive) women prenatally or at delivery for each pregnancy so that their infants, household and sexual contacts can be tested and treated to prevent the spread of the hepatitis B virus (HBV).

Surveillance: Statewide, an average of 300 infants born to HBsAg-positive women is reported annually. Based on Centers for Disease Control and Prevention (CDC) estimates, 396-597 infants born to HBsAg-positive women should be identified annually.

Prevention: Prevention of perinatal hepatitis B transmission requires the coordinated transfer of information between laboratories, primary care providers, hospitals, and the local/state health departments to ensure that all:

- Pregnant women are screened for HBsAg, all HBsAg-positive results are reported to the local health department (LHD) in the county where the patient resides within 24 hours, and the results are sent to the delivery hospital with the prenatal care record.
- Household and sexual contacts of HBsAg-positive pregnant women are identified, tested and immunized if susceptible.
- Infants of HBsAg-positive women receive appropriate prophylaxis and post-vaccination serology.
- All infants receive the birth dose of hepB vaccine prior to hospital discharge.

To view the manual in its entirety or to obtain additional copies go to www.michigan.gov/hepatitisB.

See the 12/23/05 MMWR: "A Comprehensive Immunization Strategy to Eliminate Transmission of Hepatitis B Virus Infection in the United States" for the latest Advisory Committee on Immunization Practices (ACIP) recommendations, at <http://www.cdc.gov/mmwr/preview/mmwrhtml/rr5416a1.htm>.

Your Role in the Perinatal Hepatitis B Prevention Program (PHBPP)

If you work in a laboratory:

- Report all hepatitis B surface antigen-positive (HBsAg-positive) results to the local health department (LHD) in the county where the patient resides within 24 hours of discovery
- Report all HBsAg results to the ordering physician

If you provide prenatal care:

- Test every pregnant woman during each pregnancy for HBsAg
- Inform pregnant women of their HBsAg status
- Send copy of HBsAg test result for current pregnancy with prenatal records to delivery hospital
- Report all HBsAg-positive pregnant women to the LHD within 24 hours
- Counsel HBsAg-positive pregnant women about their status and refer for appropriate care
- Contact the pediatric provider to communicate the woman's HBsAg-positive status and the need for hepatitis B (hepB) vaccination and hepatitis B immune globulin (HBIG) for the infant
- Assess HBsAg-negative pregnant woman's risk for hepatitis B infection
- Counsel HBsAg-negative pregnant woman on methods to prevent hepatitis B transmission
- Vaccinate pregnant HBsAg-negative women if high risk
- Retest high risk pregnant HBsAg-negative women in their last trimester

If you work in the hospital labor and delivery unit or in the nursery unit:

- Review and record the maternal HBsAg test result for the current pregnancy on both labor and delivery record and on infant's delivery summary sheet
 - If a woman presents with an unknown HBsAg status or with risk factors, test STAT
 - If STAT test is HBsAg-positive, report to the LHD within 24 hours
- Give all infants single-antigen hepB vaccine at birth
- Give all infants born to HBsAg-positive women single-antigen hepB vaccine and HBIG within 12 hours of birth
- Report administration of HBIG and hepB on the electronic birth certificate (EBC) worksheet
- Record the maternal HBsAg testing date and result on all newborn screening (NBS) cards
- Report all HBsAg-positive women and the HBIG and hepB administration to the PHBPP

If you provide pediatric care:

- Know the maternal HBsAg status for all infants to whom you provide care
- Complete the recommended hepB vaccine series and post-vaccination serology for all infants born to HBsAg-positive women
 - If infant is HBsAg and anti-HBs negative, repeat three doses of hepB vaccine and retest one month later
 - If the infant is HBsAg-positive, counsel the family and refer the infant for appropriate care
- Record vaccine administration in the Michigan Care Improvement Registry (MCIR)
- Report hepB administration and post-vaccination serology results to the PHBPP

If you provide health care to a contact of an HBsAg-positive woman:

- Identify, test and treat all household and sexual contacts of women who are HBsAg-positive
- Counsel HBsAg-positive contacts and refer them for appropriate care
- Give susceptible contacts three doses of hepB vaccine and complete post-vaccination serology
- Record vaccine administration in the Michigan Care Improvement Registry (MCIR)
- Report hepB administration and post-vaccination serology results to the PHBPP

Perinatal Hepatitis B Prevention Program (PHBPP) Services

Universal Hepatitis B Vaccination Program:

Hospitals who are enrolled in this program receive free hepatitis B (hepB) vaccine to give to all infants at birth. This service acts as a “safety net” to prevent both horizontal and vertical transmission.

Hepatitis B vaccine and hepatitis B immune globulin (HBIG):

Infants, household and sexual contacts enrolled in the perinatal program are eligible for free hepB vaccine, HBIG, and testing.

Free Hepatitis B test kits are available for:

- Pregnant women who do not have insurance or Medicaid, for the initial prenatal work-up and for re-testing if high risk
- Infants born to hepatitis B surface antigen-positive (HBsAg-positive) women after completion of the hepB vaccine series
- Household and sexual contacts of HBsAg-positive pregnant women

Case management services:

Educational information, support and tracking are provided to ensure hepatitis B vaccine series completion and testing. These services are available to all infants, household and sexual contacts associated with the pregnant HBsAg-positive woman reported to the PHBPP.

Guide to Perinatal Hepatitis B Prevention:

A comprehensive manual is available at www.michigan.gov/hepatitisB with sections specifically designed for:

- OB/GYN Providers
- Laboratories
- Hospitals
- Local Health Departments
- Family Practice Providers
- Pediatric Care Providers

Educational sessions:

- Perinatal Hepatitis B Prevention with 1.0 contact hours
- Hepatitis A-E with 1.5 contact hours
- Hepatitis A-E and post-exposure prophylaxis with 1.5 contact hours

If you have any questions, or for additional information on how to obtain these services contact the PHBPP staff at 517-335-8122 or 800-964-4487. In southeast Michigan, call 313-456-4431 or 313-456-4432.

Michigan Infant Dies from Perinatal Hepatitis B Virus (HBV) Infection

A three-month-old infant died from acute HBV infection due to an error in reporting. After a review of provider and hospital records, it was determined that the infant's mother was chronically infected with HBV and tested hepatitis B surface antigen-positive (HBsAg-positive) during her pregnancy. Unfortunately, the test results were not reported from the laboratory to the local health department (LHD), and the provider inaccurately reported the mother's results as HBsAg-negative to the delivery hospital.

Since the information from the prenatal care provider indicated that the infant's mother was negative for HBV, the infant did not receive hepB vaccine or hepatitis B immune globulin (HBIG) as recommended for all infants born to HBsAg-positive women. The infant became ill at three months of age and died less than two weeks later due to fulminant HBV infection.

This tragedy illustrates the necessity that all laboratories and ordering physicians comply with Michigan law. It is absolutely critical that every HBsAg-positive result for pregnant women is reported to the LHD and to the delivery hospital.

What Happens to Infants Born to HBsAg-positive Women?

WITHOUT HepB vaccine or HBIG:

- 90% will be at risk for chronic infection
- 25% of those infected will die due to chronic liver disease

WITH HepB vaccine alone in a 3 or 4 dose series started at birth:

- 70% - 95% will be protected from getting HBV infection

WITH HepB vaccine and HBIG started at birth:

- 80% - 95% will be protected from getting HBV infection

Perinatal Hepatitis B Prevention Program

■ Births to HBsAg-positive women

■ HBIG & 3 by 8 months

■ HBIG & 3 by 12 months

■ Post serology

Overview: What Pediatricians Need to Know

Disease Burden

United States:*

- 20,000 infants born annually to hepatitis B surface antigen-positive (HBsAg-positive) women
- 1,000 infants chronically infected with hepatitis B virus (HBV) annually due to infected mothers not being identified and the infant not receiving appropriate post-exposure prophylaxis
- Chronic HBV infection develops in:
 - 90% of children infected at birth
 - 30%-60% of children infected between 1-5 years of age
 - 2%-6% of children infected at 6 years of age and older

Michigan:

- 396-597 infants born to HBsAg-positive women should be identified annually
- 300 infants born to HBsAg-positive women reported annually
- 31 children (under 18 years of age) reported as HBsAg-positive annually from 1994-2004

Prevention

Prevention of HBV transmission requires the coordinated transfer of information between laboratories, primary care providers, hospitals, and the local/state health departments to ensure:

- Maternal HBsAg status is determined for all pediatric patients
- Household children/adolescent contacts of HBsAg-positive women are identified, tested and immunized if susceptible
- Infants of HBsAg-positive women receive appropriate prophylaxis and post-vaccination serology

* [Centers for Disease Control and Prevention \(CDC\) Guidelines for Viral Hepatitis Surveillance and Case Management, January 2005.](#)

Health Care Provider Responsibilities for Infant(s) Born to Hepatitis B Surface Antigen-Positive (HBsAg-positive) Women

Review the Michigan Care Improvement Registry (MCIR), and/or the Official Immunization Record to determine if the infant received the hepatitis B (hepB) vaccine and the hepatitis B immune globulin (HBIG) at birth.

Give a dose of single-antigen hepB vaccine at 1-2 months of age or Pediarix™ or Comvax® at 2 months of age. (If this infant weighed less than 2000 g at birth, do not count the birth dose of hepB vaccine as part of the series and give three additional doses.) *

If using Pediarix™ or Comvax® a dose can be given at 4 months of age.

Give the last dose of single-antigen or Pediarix™ hepB vaccine at 6 months of age (no sooner than 24 weeks of age), or Comvax® at 12-15 months of age. *

Draw or arrange with the Perinatal Hepatitis B Case Manager to have the infant's blood tested for HBsAg & hepatitis B surface antibody (anti-HBs) at 9-18 months of age, (3 months after the completion of the vaccine series). *

If HBsAg and anti-HBs are both negative, begin 2nd vaccine series using single-antigen hepB vaccine at (0, 1, 6 month schedule) and repeat the blood test 1-2 months after the second hepB vaccine series. *

*Report the vaccination dates and the date and results of the blood tests using the [Hepatitis B Perinatal Case Report-Infant/Contact Form](#) or the [Provider Reporting Form](#). Also make sure to update the patient's MCIR record. If you have any questions, please call the Perinatal Hepatitis B Prevention Program staff at 517-335-8122 or 800-964-4487. In southeast Michigan, call 313-456-4431 or 313-456-4432.

Follow-up Protocol for Infants Born to Hepatitis B Surface Antigen-Positive (HBsAg-positive) Women

1. Review the Michigan Care Improvement Registry (MCIR), and/or the Official Immunization Record to determine if the infant received the hepatitis B (hepB) vaccine and the hepatitis B immune globulin (HBIG) at birth.
2. **At 1-2 months of age:**
 - A. Give the infant a dose of single-antigen hepB vaccine at 1-2 months of age, or Pediarix™ (DTaP-HepB-IPV) or Comvax® (HepB-Hib) at 2 months of age, intramuscularly in the anterolateral thigh (at least 4 weeks after the first dose).
 - B. Complete a [Hepatitis B Perinatal Case Report-Infant/Contact Form](#) or a [Provider Reporting Form](#) and mail or fax the information to the Perinatal Hepatitis B Prevention Program (PHBPP).
 - C. Flag the infant's chart as a reminder of when the next dose is due, ask the parent for current telephone and address information and update the patient's MCIR record.
3. If using Pediarix™ or Comvax®, a dose of the hepB vaccine can be given at the 4 month-visit intramuscularly in the anterolateral thigh.
 - A. Complete a [Hepatitis B Perinatal Case Report-Infant/Contact Form](#) or a [Provider Reporting Form](#) and mail or fax the information to the PHBPP.
 - B. Flag the infant's chart as a reminder of when the next dose is due, ask the parent for current telephone and address information and update the patient's MCIR record.
4. **At 6 months of age:**
 - A. Give the infant the last dose of single-antigen hepB vaccine or Pediarix™ at 6 months of age, or if using Comvax® give the last dose at 12-15 months of age, intramuscularly in the anterolateral thigh (at least 8 weeks after the second dose, at least 16 weeks after the first, and no earlier than 24 weeks of age).
 - B. Inform the parent that the infant will need a blood test at 9-18 months of age, (3 months after the completion of the hepB vaccine series), to see if the baby has been protected from the hepatitis B virus.
 - C. Complete a [Hepatitis B Perinatal Case Report-Infant/Contact Form](#) or a [Provider Reporting Form](#) and mail or fax the information to the PHBPP.
 - D. Flag the infant's chart as a reminder of when the blood test is due, ask the parent for current telephone and address information, and update the patient's MCIR record.
5. **At nine to eighteen months of age (3 months after the completion of the vaccine series):**
 - A. Draw or refer the infant for **HBsAg** and hepatitis B surface antibody (**anti-HBs**) testing. To make arrangements for free testing contact the PHBPP case manager.
 - B. Complete a [Hepatitis B Perinatal Case Report-Infant/Contact Form](#), or a [Provider Reporting Form](#) and mail or fax the information to the PHBPP.
 - C. Ask the parent for current telephone and address information and update the patient's MCIR record.

If you have questions, or need test kits, please call the PHBPP staff at 517-335-8122 or 800-964-4487. In southeast Michigan, call 313-456-4431 or 313-456-4432.

Health Care Provider Responsibilities for Contacts of Hepatitis B Surface Antigen-Positive (HBsAg-positive) Women

† **PLEASE NOTE:**

If the patient has documentation they have started the series, complete the series and then test 1-2 months later.

Follow-up Protocol for Household and Sexual Contacts

Assess: Immunization status for all contacts through the Michigan Care Improvement Registry (MCIR) to determine if hepatitis B (hepB) vaccine or testing is needed. Those with a partially completed hepB vaccination series should complete the vaccine series and then have follow-up serology 1-2 months later.

Test: Exposed household contacts and sexual partners of women who test positive for hepatitis B surface antigen (HBsAg) prenatally or at delivery to determine their hepatitis B status. The following tests should be completed:

HBsAg: Determines if they are currently infected with the hepatitis B virus (HBV)

Anti-HBs: (Hepatitis B surface antibody) determines if they have protection against HBV

If both tests are **NEGATIVE**, the contact is susceptible to infection and should receive hepB vaccine. If HBsAg is positive, the patient is infected and should be referred for appropriate medical follow up. If anti-HBs is positive, and the contact had three valid doses of hepB vaccine, they are considered immune and are protected from getting HBV.

Vaccinate: All unvaccinated susceptible contacts with three doses of hepB vaccine:

- The first dose should be given at the same visit, but after the blood draw.
- The second dose should be given ONE MONTH after the first dose.
- The third dose should be given FOUR-SIX MONTHS after the first dose (at least eight weeks after the second dose and at least sixteen weeks after the first dose).

If there has been a sexual exposure within the last 14 days to an acutely infected HBsAg-positive woman, or a blood exposure within the last 7 days to an HBsAg-positive woman, the contact should also receive one dose of hepatitis B immune globulin (HBIG*), calculated at 0.06 ml/kg of body weight.

Test: All contacts for HBsAg and anti-HBs one to two months after the third dose of hepB vaccine is administered.

Report: All doses of hepB and HBIG on a [Hepatitis B Perinatal Case Report-Infant/Contact Form](#) or the [Provider Reporting Form](#) and mail or fax the information to the Perinatal Hepatitis B Prevention Program (PHBPP). Update the patient's MCIR record and ask for current telephone and address information.

For questions or assistance, please call the PHBPP staff at 517-335-8122 or 800-964-4487. In southeast Michigan, call 313-456-4431 or 313-456-4432.

*Suggested interval between immune globulin preparations and live virus vaccines is 3 months.

Hepatitis B Facts: Testing and Vaccination

— Who should be vaccinated? —

The following persons should receive routine hepatitis B vaccination, according to the Centers for Disease Control and Prevention (CDC):

Routine vaccination:

- All newborns at birth prior to hospital discharge
- All children and teens ages 0 through 18 years
- All persons who wish to be protected from hepatitis B virus (HBV) infection. CDC states it is not necessary for the patient to disclose a risk factor to receive hepatitis B vaccine.

Persons who are at risk for sexual exposure:

- Sexually active persons who are not in long-term, mutually monogamous relationships
- Sex partners of HBsAg-positive persons
- Persons seeking evaluation or treatment for an STD
- Men who have sex with men

Persons at risk for infection by percutaneous or mucosal exposure to blood:

- Current or recent injection-drug users
- Household contacts of HBsAg-positive persons
- Residents and staff of facilities for developmentally challenged persons
- Healthcare and public safety workers with reasonably anticipated risk for exposure to blood or blood-contaminated body fluids
- Persons with end-stage renal disease and those receiving dialysis

Others:

- Travelers to areas with moderate or high rates of HBV infection
- Persons with chronic (life-long) liver disease
- Persons with HIV infection

Refugees, immigrants, and adoptees from countries where HBV infection is endemic should be screened. Adults should discuss their need or desire for hepatitis B vaccination with their healthcare providers.

For certain people at risk, postvaccination testing is recommended. Consult ACIP recommendations for details (see references).

— Hepatitis B lab nomenclature —

HBsAg: *Hepatitis B surface antigen* is a marker of infectivity. Its presence indicates either acute or chronic HBV infection.

Anti-HBs: *Antibody to hepatitis B surface antigen* is a marker of immunity. Its presence indicates an immune response to HBV infection, an immune response to vaccination, or the presence of passively acquired antibody. (It is also known as **HBsAb**, but this abbreviation is best avoided since it is often confused with abbreviations such as HBsAg.)

Anti-HBc (total): *Antibody to hepatitis B core antigen* is a nonspecific marker of acute, chronic, or resolved HBV infection. It is *not* a marker of vaccine-induced immunity. It may be used in prevaccination testing to determine previous exposure to HBV infection. (It is also known as **HBcAb**, but this abbreviation is best avoided since it is often confused with other abbreviations.)

IgM anti-HBc: *IgM antibody subclass of anti-HBc*. Positivity indicates recent infection with HBV (within the past 6 mos). Its presence indicates acute infection.

HBsAg: *Hepatitis B “e” antigen* is a marker of a high degree of HBV infectivity, and it correlates with a high level of HBV replication. It is primarily used to help determine the clinical management of patients with chronic HBV infection.

Anti-HBe: *Antibody to hepatitis B “e” antigen* may be present in an infected or immune person. In persons with chronic HBV infection, its presence suggests a low viral titer and a low degree of infectivity.

HBV-DNA: *HBV Deoxyribonucleic acid* is a marker of viral replication. It correlates well with infectivity. It is used to assess and monitor the treatment of patients with chronic HBV infection.

— Screening before vaccination —

Serologic testing prior to vaccination may be undertaken based on your assessment of your patient’s level of risk and your or your patient’s need for definitive information (see information in the left column). If you decide to test, draw the blood first, and then give the first dose of vaccine at the same office visit. Vaccination can then be continued, if needed, based on the results of the tests. If you are not sure who needs hepatitis B screening, consult your state or local health department.

Tests	Results	Interpretation	Vaccinate?
HBsAg anti-HBc anti-HBs	negative negative negative	susceptible	vaccinate if indicated
HBsAg anti-HBc anti-HBs	negative negative positive with ≥10mIU/mL	immune due to vaccination	no vaccination necessary
HBsAg anti-HBc anti-HBs	negative positive positive	immune due to natural infection	no vaccination necessary
HBsAg anti-HBc IgM anti-HBc anti-HBs	positive positive positive negative	acutely infected	no vaccination necessary
HBsAg anti-HBc IgM anti-HBc anti-HBs	positive positive negative negative	chronically infected	no vaccination necessary (may need treatment)
HBsAg anti-HBc anti-HBs	negative positive negative	four interpretations possible*	use clinical judgment

- *1. May be recovering from acute HBV infection
2. May be distantly immune, but the test may not be sensitive enough to detect a very low level of anti-HBs in serum
3. May be susceptible with a false positive anti-HBc
4. May be chronically infected and have an undetectable level of HBsAg present in the serum

— Managing chronic HBV infection —

When you identify a patient who is chronically infected with HBV, make sure you consult a specialist knowledgeable in the treatment of liver disease so your patient’s care is optimized. Chronically infected persons need medical evaluation every 6–12 mos to assess the status of their liver health and their need for antiviral therapy, as well as to screen for liver cancer. In addition, persons with chronic HBV infection should be educated about their disease and how to protect others.

Household members and sex partners should be tested for HBV infection and given the first dose of hepatitis B vaccine at the same visit. (Vaccinating a person who has already been infected will do no harm). If testing indicates HBV susceptibility, complete the hepatitis B vaccination series. If testing indicates HBV infection, consultation and further care with a physician knowledgeable about chronic hepatitis B is needed.

Hepatitis B Perinatal Case Report – Infant/Contact

Michigan Department of Community Health (MDCH)

Please complete this form each time a dose of hepatitis B vaccine and/or hepatitis B immune globulin (HBIG) is administered to an infant whose mother has tested hepatitis B surface antigen (HBsAg) positive or when given to her household or sexual contacts. **Mail** this form to MDCH, Immunization Division, PO Box 30195, Lansing, MI 48909; or **fax** to 517-335-9855; or **call** the Perinatal Hepatitis B Prevention staff at 517-335-8122 or 1-800-964-4487. In **southeast Michigan**, **mail** to MDCH, Immunization Division, Detroit Regional Office, 3056 W. Grand Blvd., Suite 3-150, Detroit, MI 48202; or **fax** to 313-456-4427; or **call** 313-456-4431 or 313-456-4432. Also, please make sure to update the infant/contact's Michigan Care Improvement Registry (MCIR) record.

PROVIDER REPORTING FORM

Please complete this form each time a dose of hepatitis B vaccine is administered to an infant whose mother has tested hepatitis B surface antigen-positive (HBsAg-positive), or to her household or sexual contacts. Please mail this form to MDCH, Detroit Regional Office, 3056 West Grand Boulevard, Suite 3-150, Detroit, MI 48202, fax it to 313-456-4427 or call the Perinatal Hepatitis B Prevention Program (PHBPP) with the information to 313-456-4432. Also, please update the child's Michigan Care Improvement Registry (MCIR) record.

_____ was post-vaccination tested.

Date: _____

PLEASE RETURN WITH A COPY OF THE LABORATORY RESULTS

(Circle test results)

HBsAg: **Positive*** **Negative**

* A positive test indicates infection with hepatitis B.
Desired result is negative.

Anti-HBs: **Positive*** **Negative**

* A positive test indicates protection against hepatitis B.
Desired result is positive.

REPORTABLE DISEASES IN MICHIGAN

A Guide for Physicians, Health Care Providers and Laboratories

The following is a list of conditions that should be reported to the local health department without delay if the agent is identified by clinical diagnosis, direct examination, culture, serology, molecular techniques or by histopathology.

Acquired Immunodeficiency Syndrome (AIDS)

Avian influenza

Bacillus anthracis (Anthrax)

Blastomyces dermatitidis

Bordetella pertussis (**Pertussis**)

Borrelia burgdorferi (**Lyme Disease**)

Brucella species

Burkholderia pseudomallei

Burkholderia mallei

Calymmatobacterium granulomatis

Campylobacter jejuni

Chlamydia psittaci (**Psittacosis**)

Chlamydia trachomatis (**Genital infections**), (LGV)

Chlamydia trachomatis (**Trachoma**)

Clostridium botulinum (Botulism)

Clostridium tetani (**Tetanus**)

Coccidioides immitis (**Coccidioidomycosis**)

Corynebacterium diphtheriae (Diphtheria)

Coxiella burnetii (Q Fever)

Cryptococcus neoformans

Cryptosporidium species

Cyclospora species

Dengue virus

Ehrlichia species

Encephalitis, viral

California serogroup

Eastern Equine

Powassan

St. Louis

Western Equine

West Nile

Unspecified

Entamoeba histolytica (**Amebiasis**)

Escherichia coli, O157:H7 and all other shiga toxin positive serotypes

Francisella tularensis (Tularemia)

Giardia lamblia

Guillain-Barre Syndrome

Haemophilus ducreyi (**Chancroid**)

Haemophilus influenzae, <15 years of age, sterile site

Hantavirus

Hemolytic Uremic Syndrome (**HUS**)

Hemorrhagic fever viruses

Hepatitis, viral

Hepatitis A virus, (**Anti-HAV IgM**)

Hepatitis B virus, (**HBsAg**)

within 24 hours on pregnant women

Hepatitis C virus, (**Anti-HCV**)

Hepatitis, non-ABC

Histoplasma capsulatum

HIV, (Confirmed positive HIV serology and detection tests; CD4 counts/percents and all viral loads on people already known to be infected)

Influenza virus (**Weekly aggregate counts**)

Kawasaki Disease

Leptospira species

Legionella species

Listeria monocytogenes

Meningitis, viral

Meningitis, bacterial

Measles virus (**Rubeola**)

Mumps virus

Mycobacterium bovis

Mycobacterium leprae (**Leprosy**)

Mycobacterium tuberculosis (Tuberculosis)

Neisseria gonorrhoeae (**Gonorrhea**)

Neisseria meningitidis, sterile sites (Meningococcal Disease)

Orthopox viruses (Smallpox, Monkeypox)

Poliovirus

Plasmodium species (**Malaria**)

Rabies virus

Reye's Syndrome

Rheumatic fever

Rickettsia rickettsii (**Rocky Mountain Spotted Fever**)

Rickettsia species (**Typhus Group**)

Rubella virus

Salmonella species

Salmonella typhi (Typhoid Fever)

Severe Acute Respiratory Syndrome (SARS)

Shigella species

Spongiform Encephalopathy (**Includes CJD**)

Staphylococcus aureus, vancomycin intermediate/resistant (VISA/VRSA)

Staphylococcus aureus, (**MRSA**), outbreaks only

Streptococcus pyogenes, group A, sterile sites

Streptococcus pneumoniae, sterile sites, susceptible/resistant

Toxic Shock Syndrome

Treponema pallidum (**Syphilis**)

Trichinella spiralis (**Trichinosis**)

Varicella (**Chickenpox**)

Vibrio cholerae (Cholera)

Yellow fever virus

Yersinia enterocolitica

Yersinia pestis (Plague)

Unusual occurrence, outbreak or epidemic of any disease or condition

LEGEND

Green Bold Text = An isolate or serum sample, where appropriate, is to be submitted to MDCH or other laboratory designated by MDCH. Confirmed positive HIV diagnostic sera are to be submitted for incidence testing.

Report All Listed Conditions to the Local Health Department (see reverse)
This reporting is expressly allowed under HIPAA
Communicable Disease Rules: R 325.171, 172, 173

DIRECTORY OF MICHIGAN HEALTH DEPARTMENTS BY COUNTY

Give the birth dose . . .

Hepatitis B vaccine at birth saves lives!

By **Deborah L. Wexler, MD**, Executive Director, Immunization Action Coalition

On Dec. 23, 2005, CDC issued new recommendations on hepatitis B vaccination that were published in the MMWR. The recommendations strongly support the birth dose of hepatitis B vaccine for every newborn prior to hospital discharge and also recommend the use of standing orders for giving the birth dose. Copies of original maternal hepatitis B lab reports are also recommended (instead of transcribed test results). According to the new recommendations, the birth dose should only be withheld in "rare circumstances," and if doing so, physicians should write an order **not** to give the dose, and a copy of the mother's original HBsAg-negative lab report must be on the infant's chart. The American Academy of Pediatrics, American Academy of Family Physicians, and American College of Obstetricians and Gynecologists endorse these new recommendations.

The Immunization Action Coalition (IAC) urges all health professionals and hospitals to protect all infants from hepatitis B virus (HBV) infection by administering the first dose of hepatitis B vaccine to every infant at birth and no later than hospital discharge.

Approximately 19,000 women with chronic hepatitis B virus infection give birth in the U.S. each year. Up to 95% of perinatal infections can be prevented by postexposure prophylaxis given within 12 hours of birth. Tragically, many babies are exposed to HBV at birth but do not receive appropriate postexposure prophylaxis.

The primary advantage of giving the first dose at birth is that IT SAVES LIVES.

Why is such a policy necessary? Following are some of the ways infants who are not vaccinated at birth can become infected:

- The pregnant woman is tested and found to be hepatitis B surface antigen (HBsAg) positive, but her status is not communicated to the newborn nursery. The infant receives neither hepatitis B vaccine nor HBIG protection at birth.
- A chronically infected pregnant woman is tested with the wrong test. For example, antibody to hepatitis B surface antigen is sometimes ordered in error instead of HBsAg. This can happen because some laboratories use the improper and confusing abbreviation HBsAb instead of anti-HBs. This misordering of a test is relatively common since the two abbreviations (HBsAg and HBsAb) differ by only one letter. However, when her incorrectly ordered test comes back "negative," the woman may have actually been HBsAg positive and her infant would not receive appropriate postexposure prophylaxis.
- The pregnant woman is HBsAg positive, but her test results are misinterpreted or mistranscribed into her prenatal record or her infant's chart. Her infant does not receive HBIG or hepatitis B vaccine.
- The pregnant woman is not tested for HBsAg ei-

ther prenatally or in the hospital at the time of delivery. Women in this group have a higher likelihood of being HBsAg-positive (in one study, women who didn't receive prenatal care were 8 times more likely to be HBsAg positive than women who received such care). Her infant does not receive hepatitis B vaccine in the hospital, even though it is recommended within 12 hours of birth for infants whose mothers' test results are unknown.

- The woman is tested in early pregnancy for HBsAg and is found to be negative. She develops HBV infection later in pregnancy, but it is not detected, even though it is recommended by CDC that high-risk women be retested later in pregnancy. Because the infection is not clinically detected by her health care provider, her infant does not receive hepatitis B vaccine or HBIG at birth.
- The mother is HBsAg negative, but the infant is exposed to HBV postnatally from another family member or caregiver. This occurs in two-thirds of the cases of childhood transmission.

While there are certain advantages to giving the first dose at a later well-baby visit, these are advantages of administrative convenience. The primary advantage of giving the first dose at birth is that it saves lives.

In 2001 and 2002, IAC surveyed hepatitis coordinators at every state health department as well as at city and county CDC projects to express their views about providing hepatitis B vaccine in the hospital. Their responses contained many examples of children who were unprotected or inadequately protected because health professionals failed to order or misordered the hepatitis B blood test or misinterpreted, mistranscribed, or miscommunicated the test results of the children's mothers.

These state coordinators' reports tell us that no matter how well healthcare providers think they are doing with HBsAg screening of all pregnant women, serious mistakes continue to occur; children are unnecessarily being exposed without the benefit of postexposure prophylaxis, and at least

To obtain the CDC recommendations (12/23/05) for hepatitis B immunization of infants, children, and adolescents, go to: www.cdc.gov/mmwr/pdf/rr/rr5416.pdf.

For more information on the importance of giving the birth dose, and results from IAC's survey of state hepatitis B coordinators, go to: www.immunize.org/birthdose.

one baby has died. In order to overcome these failures, all 50 state hepatitis B coordinators overwhelmingly endorse providing a birth dose.

To maximally protect every newborn, ACIP recommends we vaccinate *all* infants (regardless of the mother's HBsAg status) prior to hospital discharge with Engerix-B® or Recombivax HB®. Providers who wish to complete the series using hepatitis B-containing combination vaccines (Comvax®, Pediarix®), may do so by giving three additional doses. Giving a total of four doses of hepatitis B vaccine to infants is acceptable to CDC, AAP, AAFP, and these vaccine doses are covered under the Vaccines for Children (VFC) program.

All 50 state hepatitis B coordinators overwhelmingly endorse providing a birth dose.

Hepatitis B vaccine is a highly effective vaccine. Studies have shown that infants of the most highly infectious mothers (women who are both HBsAg and HBeAg positive) who receive postexposure prophylaxis with hepatitis B vaccine alone (without HBIG) at birth are protected in up to 95% of cases, essentially the same level of protection afforded by administering hepatitis B vaccine in addition to HBIG. Even higher rates of protection with postexposure prophylaxis have been demonstrated in infants born to less infectious mothers (those who are HBsAg positive and HBeAg negative).

Please read the hepatitis coordinators' survey results (see the web address box above), including descriptions of their experiences with failures of the current system—failures that largely will be prevented by administering hepatitis B vaccine to infants before they go home from the hospital.

Your support for providing a birth dose of hepatitis B vaccine to infants while still in the hospital will protect and save lives that are now being put at risk. ♦

Eligibility and Ordering Protocol: Hepatitis B Vaccine and Hepatitis B Immune Globulin for Infants and Contacts of Hepatitis B Surface Antigen-Positive Women

Summary:

Hepatitis B (hepB) vaccine and hepatitis B immune globulin (HBIG) are available on an as-needed basis for administration in private provider offices, hospitals, local health departments, health centers, and clinics for the care of those clients currently enrolled in the Perinatal Hepatitis B Prevention Program (PHBPP).

Eligibility for those currently enrolled in the PHBPP:

HepB vaccine and HBIG:

- Infants born to hepatitis B surface antigen-positive (HBsAg-positive) women

HepB vaccine:

- Susceptible household and sexual contacts of HBsAg-positive women

HBIG*:

- Susceptible household and sexual contacts of HBsAg-positive women should receive HBIG within 7 days of an identifiable blood exposure.
- Susceptible sexual contacts of acutely HBsAg-positive women should receive HBIG within 14 days of a sexual exposure.

Infants born to HBsAg-positive women should receive HBIG and 3 doses of single-antigen hepB vaccine at 0, 1-2 and 6 months of age. If using hepB-containing combination vaccines, give HBIG and a single-antigen dose of hepB vaccine within 12 hours of birth and complete the series with doses at 2, 4 and 6 months of age if using Pediarix®; or with doses at 2, 4, & 12-15 months of age if using Comvax®. Post-vaccination serology should be done at 9-18 months of age (3 months after the completion of the hepB vaccine series). Susceptible household and sexual contacts of HBsAg-positive women should receive 3 doses of hepB vaccine on a schedule of 0, 1 and 4-6 months with post-vaccination serology 1-2 months after the completion of the vaccine series.

Private Providers, Hospitals, Health Centers, Clinics and Local Health Departments (LHD):

Whenever hepB vaccine and/or HBIG are administered to eligible infants or contacts in the PHBPP a *Hepatitis B Perinatal Case Report-Infant/Contact* should be completed and forwarded to the PHBPP Case Manager.

HepB Vaccine Orders:

All private providers, hospitals, health centers, and clinics may order hepB vaccine from their LHD. The LHD will place orders through the Michigan Department of Community Health (MDCH) Immunization Division either by faxing a request to 517-335-9855 or by e-mailing the Michigan Vaccines for Children (VFC) Program at mdchvariorder@michigan.gov. The VFC Program will begin transitioning to electronic ordering via the Michigan Care Improvement Registry (MCIR). The LHD and MCIR staff will help with the transition and with an ordering frequency plan to assure adequate vaccine supply for all facilities. Once all providers are transitioned to the electronic ordering, all orders for hepB vaccine will be electronically submitted to the LHD and all LHDs will electronically submit their orders directly to MDCH. All doses of hepB vaccine administered should be recorded in the MCIR and accounted for on the *VFC Programs Vaccine Doses Administered Reporting Form*, which should be submitted to the LHD. The LHD should also account for hepB vaccine on the *Local Health Department Monthly Vaccine Inventory Report*.

HBIG Orders:

Requests for HBIG should continue to be forwarded to the PHBPP.

All doses of hepB vaccine and/or HBIG given in the hospital should be entered in MCIR, via the Electronic Birth Certificate (EBC) process or direct data entry, so that all doses can be electronically recorded.

For additional information, please call the PHBPP program staff at 517-335-8122 or 800-964-4487. In southeast Michigan, call 313-456-4431 or 313-456-4432.

*Suggested intervals between immune globulin preparations and live virus vaccines are 3 months.

Hepatitis B Vaccine and Hepatitis B Immune Globulin Administration for Infants

Maternal Status	Infants greater than or equal to 2000 g *	Infants less than 2000 g *
Hepatitis B Surface Antigen (HBsAg) positive	<p>Give single-antigen hepatitis B (hepB) vaccine and hepatitis B immune globulin (HBIG) within 12 hours of birth.</p> <p>Complete the hepB vaccine series with single-antigen doses at 1-2 and 6 months of age or hepB-containing combination vaccines given at 2, 4, and 6 months of age, or 2, 4, and 12-15 months of age depending on the combination product used. (Combination vaccines cannot be given before 6 weeks of age.)</p> <p>Test for hepatitis B surface antibody (anti-HBs) and HBsAg at 9-18 months of age (3 months after the completion of the hepB vaccine series).</p> <p>If the infant is HBsAg and anti-HBs negative, repeat the 3 dose hepB vaccine series and retest 1-2 months after the completion of the second vaccine series.</p> <p>If infant is HBsAg-positive, refer to a specialist.</p>	<p>Give single-antigen hepB vaccine and HBIG within 12 hours of birth.</p> <p>Do not count the hepB birth dose as the first dose. Initiate the full hepB vaccine series with single-antigen doses at 1, 2-3 and 6 months of age or hepB-containing combination vaccines given at 2, 4, and 6 months of age, or 2, 4, and 12-15 months of age depending on the combination product used. (Combination vaccines cannot be given before 6 weeks of age.)</p> <p>Test for anti-HBs and HBsAg at 9-18 months of age (3 months after the completion of the hepB vaccine series).</p> <p>If infant is HBsAg and anti-HBs negative, repeat the 3 dose hepB vaccine series and retest 1-2 months after the completion of the second vaccine series.</p> <p>If infant is HBsAg-positive, refer to a specialist.</p>
HBsAg status unknown	<p>Test mother STAT for HBsAg.</p> <p>Give single-antigen hepB vaccine within 12 hours of birth and HBIG within 7 days if mom's status remains unknown or sooner if found to be HBsAg-positive.</p> <p>Follow the recommended vaccination schedule.</p>	<p>Test mother STAT for HBsAg.</p> <p>Give single-antigen hepB vaccine and HBIG within 12 hours of birth if mom's status remains unknown or if found to be HBsAg-positive.</p> <p>Follow the recommended vaccination schedule.</p>
HBsAg-negative	<p>Give single-antigen hepB vaccine at birth or prior to hospital discharge.</p> <p>Follow the recommended vaccination schedule.</p> <p>Anti-HBs and HBsAg testing is not recommended.</p>	<p>Give single-antigen hepB vaccine to medically stable infants at 30 days of chronologic age or at hospital discharge if before 30 days of chronologic age.</p> <p>Follow the recommended vaccination schedule.</p> <p>Anti-HBs and HBsAg testing is not recommended.</p>

* All doses of hepB vaccine and HBIG must be entered into the Michigan Care Improvement Registry (MCIR). This may be done by entering the data directly into the MCIR or on the Electronic Birth Certificate (EBC). It is important that all providers who see the baby in a neonatal intensive care unit (NICU) or in an office enter the dose information into MCIR so that a follow-up provider knows when to give the next dose.

- Adapted from: Saari TN and the Committee on Infectious Diseases, Immunization of Preterm and Low Birth Weight Infants. *Pediatrics* 2003; 112:193-198.

Recommended Dosages of Hepatitis B Vaccine and Hepatitis B Immune Globulin Using Single-Antigen Vaccine

Hepatitis B Vaccine Recipient	Engerix-B® (GlaxoSmithKline)		Recombivax HB® (Merck)	
	Pediatric Formulation 10mcg (0.5mL) (or in prefilled syringes)	Adult Formulation 20mcg (1mL)	Pediatric/Adolescent Formulation 5mcg (0.5mL)	Adult Formulation 10mcg (1mL)
Newborns born to HBsAg (+) mothers*	10mcg (0.5mL) ¹ & (0.5mL) HBIG within 12 hours of birth		5mcg (0.5mL) ¹ & (0.5mL) HBIG within 12 hours of birth	
Newborns born to mothers whose HBsAg status is unknown*	10mcg (0.5mL) ¹ within 12 hours of birth; (0.5mL) HBIG should also be given within 7 days if mom's status remains unknown or sooner if found to be HBsAg (+)		5mcg (0.5mL) ¹ within 12 hours of birth; (0.5mL) HBIG should also be given within 7 days if mom's status remains unknown or sooner if found to be HBsAg (+)	
Newborns born to HBsAg (-) mothers*	10mcg (0.5mL) ¹		5mcg (0.5mL) ¹	
Birth - 19 years ²	10mcg (0.5mL) ¹		5mcg (0.5mL) ¹	
11 - 15 years ³				10mcg (1mL)
20 + years ²		20mcg (1mL)		10mcg (1mL)
Dialysis patients	10mcg (0.5mL)	40mcg (2mL) ⁴	5mcg (0.5mL)	40mcg (1mL) ⁵

*For newborns weighing less than 2000 g, see ([Hepatitis B Vaccine and Hepatitis B Immune Globulin Administration for Infants](#))

¹**Hepatitis B vaccine** is strongly recommended at birth. This birth dose MUST be a single antigen vaccine. A 4-dose hepatitis B series is approved in conjunction with Pediarix® or Comvax®. first three doses of DTaP and IPV vaccines). A 4-dose hepatitis B series is approved with a single-antigen dose of hepatitis B vaccine at birth followed by 3 additional doses of Pediarix®.

²**HBIG** (hepatitis B immune globulin) All susceptible contacts of an HBsAg (+) person, should receive a (0.06 mL/kg) dose of HBIG, within 7 days of a blood exposure, or within 14 days of a sexual exposure, along with the hepatitis B vaccine series.

³**Merck's 2-dose (adolescent)** hepatitis B vaccine series (using the adult formulation of Recombivax HB® 10mcg, 1 ml) is approved only for adolescents 11-15 years of age. The second dose should be administered 4-6 months after the first dose. If the 2-dose regimen is used, documentation must indicate that the adolescent received 2 adult 10mcg (1ml) doses of the Merck brand. If a child starts the hepatitis B series prior to age 11, starts the hepatitis B series between the ages of 11 and 15 with a hepatitis B vaccine other than the adult formulation of the Merck product, or completes the series after age 15, a 3-dose series should be administered. *This specific use of vaccine is not included in the VFC program.*

⁴**Engerix-B® dialysis formulation** is approved for adult hemodialysis patients by using 2 x 20mcg/1mL in one or two injections at 0, 1, 2 and 6 months.

⁵**Recombivax HB® dialysis formulation** is approved for pre-dialysis and dialysis patients in a three dose series of 40mcg/1mL at 0, 1, and 6 months.

Combination vaccines are not to be used prior to age 6 weeks, for information about the use of Comvax®, Pediarix®, and Twinrix® vaccines, see Recommended Dosages of Hepatitis B Vaccine and Hepatitis B Immune Globulin (HBIG) Including Hepatitis B Combination Vaccines.

For specific prescribing information, precautions, contraindications, and specific dialysis formulations, refer to product inserts.

Recommended Dosages of Hepatitis B Vaccine & Hepatitis B Immune Globulin (HBIG) Including Hepatitis B Combination Vaccines

	Single-Antigen Vaccines				Combination Vaccines		
Hepatitis B Vaccine Recipients	Engerix-B® (GSK)		Recombivax HB® (Merck)		Pediarix® (GSK)	Comvax® (Merck)	Twinrix® (GSK)
	Pediatric Formulation	Adult Formulation	Pediatric/Adolescent Formulation	Adult Formulation	DTaP-HepB-IPV (6 wks – 7 yrs)	Hib-HepB (6 wks – 59 mos)	HepA-HepB (18 yrs & older)
Infants born to hepatitis B surface antigen (HBsAg) positive mothers*	10mcg (0.5mL) ¹ & (0.5mL) ² HBIG within 12 hours of birth		5mcg (0.5mL) ¹ & (0.5mL) ² HBIG within 12 hours of birth				
Newborns born to HBsAg unknown mothers*	10mcg (0.5mL) ¹ within 12 hours of birth; (0.5mL) ² HBIG within 7 days if mom's status remains unknown or sooner if HBsAg-positive		5mcg (0.5mL) ¹ within 12 hours of birth; (0.5mL) ² HBIG within 7 days if mom's status remains unknown or sooner if HBsAg-positive				
Newborns born to HBsAg - negative mothers*	10mcg (0.5mL) ¹ within 12 hours of birth or prior to hospital discharge		5mcg (0.5mL) ¹ within 12 hours of birth or prior to hospital discharge				
Infants 6wks & older	10mcg (0.5mL)		5mcg(0.5mL)		10mcg (0.5mL) ^{1/3}	5mcg (.5mL) ^{1/4}	
Birth-19 years	10mcg (0.5mL)		5mcg(0.5mL)				
11-15 years⁵				10mcg (1mL) ⁵			
18 years & older							20mcg (1mL) ⁶
20 + years		20mcg (1mL)		10mcg (1mL)			20mcg (1mL) ⁶
Dialysis patients	10mcg (0.5mL)	40mcg (2mL) ⁷	5mcg (0.5mL)	40mcg (1mL) ⁸			

For specific prescribing information, precautions, contraindications, and specific dialysis formulations, refer to product inserts.

*Newborns weighing less than 2000 grams see [Hepatitis B Vaccine and Hepatitis B Immune Globulin Administration for Infants](#)

¹**Hepatitis B vaccine** is strongly recommended at birth. This birth dose MUST be a single antigen vaccine. A 4-dose hepatitis B series is approved in conjunction with Pediarix® or Comvax®.

²**HBIG** (hepatitis B immune globulin) All infants born to HBsAg-positive women should receive (0.5mL) HBIG within 12 hours of birth. All susceptible contacts of an HBsAg-positive person, should receive a (0.06 mL/kg) dose of HBIG, within 7 days of a blood exposure, or within 14 days of a sexual exposure, along with the hepatitis B vaccine series.

³**Pediarix®** (DTaP, hepatitis B and IPV) - GlaxoSmithKline (GSK)'s combination vaccine used as an alternative to single antigens for administration at 2, 4 and 6 months of age. This combination vaccine is NOT to be given at birth. It may be given to any child between ages 6 weeks to 7 years of age for whom no antigen is contraindicated, and only as a primary series. (Primary series is considered first three doses of DTaP and IPV vaccines.) A 4-dose hepatitis B series is approved with a single-antigen dose of hepatitis B vaccine at birth followed by 3 additional doses of hepatitis B vaccine.

⁴**Comvax®** (hepatitis B and Hib) - Merck's combination vaccine used as an alternative to single antigens for administration to any child 6 weeks to 59 months of age at 2, 4 and 12-15 months of age when neither antigen is contraindicated. This combination vaccine is NOT to be given at birth. A 4-dose hepatitis B series is approved with a single-antigen dose of hepatitis B vaccine at birth followed by 3 additional doses of hepatitis B vaccine.

⁵**Adolescent 2-dose series** - Merck's 2 dose adult Recombivax HB® (10mcg, 1 ml) used only for adolescents 11-15 years of age administered at 0 and 4-6 months apart. If this 2-dose regimen is used, documentation must indicate adolescent received 2 adult (10mcg, 1ml) doses of the Merck brand. If child starts hepatitis B series prior to age 11, between the ages of 11 and 15 with a hepatitis B vaccine other than adult formulation of Merck product, or completes series after age 15, a 3-dose series should be administered. *This specific use of vaccine is not included in VFC program.*

⁶**Twinrix®** (hepatitis A and hepatitis B) – GSK's combination vaccine used as an alternative to single antigens for persons 18 years of age and older at 0, 1 & 6 months when neither antigen is contraindicated.

⁷**Engerix-B® dialysis formulation** is approved for adult hemodialysis patients 20 years and older by using 2 x 20mcg/1mL at one site in one or two injections at 0, 1, 2 and 6 months.

⁸**Recombivax HB® dialysis formulation** is approved for pre-dialysis and dialysis patients in a three dose series of 40mcg/1mL at 0, 1, and 6 months.

Vaccination Schedule for Infants Born to Hepatitis B Surface Antigen-Positive (HBsAg-positive) Women

Dose	Single-antigen vaccine	Combination Vaccines	
	Engerix-B® or Recombivax HB® (HepB)	Pediarix® (DTaP-HepB-IPV)	Comvax® (HepB-Hib)
1	Birth*	Birth (only use single antigen vaccine)*	Birth (only use single antigen vaccine)*
2	1-2 months	2 months	2 months
3	6 months	4 months	4 months
4	NA	6 months	12-15 months

* Both single-antigen hepatitis B (hepB) vaccine (0.5mL) and hepatitis B immune globulin (HBIG) (0.5mL) should be given within 12 hours of birth. HBIG and hepB vaccine should be administered intramuscularly at different sites.

Combination Vaccines

After single-antigen hepB vaccine is given at birth, an additional 3 doses of a hepB-containing combination vaccines can be given to complete the series, starting at 6 weeks of age for those whom none of the antigens are contraindicated.

Comvax®: The combination hepatitis B and *Haemophilus influenzae* type B (Hib) vaccine
Comvax® is NOT to be given at birth. Comvax® is licensed for use as a 3-dose series beginning at 6 weeks of age. This vaccine may be used when neither antigen is contraindicated.

Pediarix®: The combination DTaP-hepatitis B-inactivated poliovirus vaccine
Pediarix® is NOT to be given at birth. Pediarix® is licensed for use as a 3-dose series beginning at 6 weeks to 7 years of age. This vaccine may be used when none of the antigens are contraindicated and only as a primary series.

Pre-term Infants

For pre-term infants who weigh less than 2000 g at birth, administer hepB vaccine and HBIG within 12 hours of birth. The initial hepB vaccine dose should not be counted as part of the 3-dose hepB vaccine series. Three additional doses of hepB vaccine should be administered beginning at chronological age of 1 month.

Note: The use of brand names is not meant to preclude the use of other comparable licensed hepB-Hib or DTaP-hepB-IPV combination vaccines.

Vaccine Storage Basics

1. Keep the refrigerator/freezer plugged in and cold

1. Refrigerators should have separate, sealed refrigerator & freezer compartments
2. Have separate temperature controls for refrigerator & freezer compartments
 - a. Put certified thermometers in the refrigerator and in the freezer
 - b. Check and record the temperature in the refrigerator & freezer twice daily
 - c. Use a safety plug or plug cover to prevent accidental disconnection
 - d. Place “DO NOT UNPLUG” warnings near the outlet and circuit breaker
 - e. Keep water bottles in refrigerator and ice packs in freezer

2. Keep these vaccines in the refrigerator (35° – 46° F or 2° – 8° C)

LAIV	Hep B	Rota
DTaP, Tdap, Td, DT	HPV4	PCV7
Hib	MMR*	PPV23
IPV	MCV4	TIV
Hep A	MPSV4	

- a. Put them in the refrigerator as soon as they arrive

3. Keep these vaccines frozen (5°F or -15°C or lower)

Varicella	MMRV
MMR*	Zoster

- a. Put them in the freezer as soon as they arrive

4. Keep vaccines protected from light

- a. Remove individual dose vials from cardboard package only as needed

5. Do not allow vaccine to expire

- a. Check expiration dates monthly
- b. Place vaccines so those that will expire first are used first
- c. Stock only what you can use in 1– 2 months
- d. For VFC vaccine: call your local health department VFC contact person if any of your VFC vaccine will expire in 3-6 months

6. Transport vaccines correctly

- a. Refrigerated vaccines must be transported in an insulated cooler with a barrier separating the vaccines from the ice/cold packs
- b. Place a thermometer in the cooler to monitor the temperature
- c. Frozen vaccines can only be transported in an insulated cooler with dry ice
- d. Place vaccines appropriately in the refrigerator or freezer immediately upon arrival at the clinic

* MMR vaccine can be stored in the refrigerator or the freezer

Injectable Vaccine Administration for Children Birth-6 years

Vaccine	Age/Reminders	Route	Site ☐	Needle*	Contraindications ⊕
Diphtheria, Tetanus, Pertussis (DTaP)	6 weeks-6 years	IM	Anterolateral Thigh or Deltoid [±]	1"-1.5" 22-25 g	Anaphylactic reaction to prior dose or component; encephalopathy without other cause within 7 days of a pertussis-containing vaccine
<i>Haemophilus influenza</i> type B (Hib)	No routine doses after 59 months	IM	Anterolateral Thigh or Deltoid	1"-1.5" 22-25 g	Anaphylactic reaction to prior dose or component
Pneumococcal conjugate (PCV7)	No routine doses after 59 months	IM	Anterolateral Thigh or Deltoid	1"-1.5" 22-25 g	Anaphylactic reaction to prior dose or component
Hepatitis B (Hep B)	1 st dose at birth; last dose at/after 6 months	IM	Anterolateral Thigh or Deltoid	1"-1.5" 22-25 g	Anaphylactic reaction to a prior dose or component (baker's yeast)
Inactivated Polio Vaccine (IPV)	For school entry: 1 st dose at/ after 6 wks of age; all doses spaced at least 4 weeks apart	SC	Anterolateral Thigh or Lateral Upper Arm	5/8" 23-25 g	Anaphylactic reaction to a prior dose or component (neomycin, streptomycin, polymyxin B)
		IM	Anterolateral Thigh or Deltoid	1"-1.5" 22-25 g	
Measles, Mumps, Rubella (MMR)	1 st dose at/after 12 mo; 4 week interval between two doses (all ages)	SC	Anterolateral Thigh or Lateral Upper Arm	5/8" 23-25 g	Anaphylactic reaction to a prior dose or component (neomycin or gelatin); pregnancy
Varicella (Var)	1 st dose at/after 12 mo; 3 mo interval between doses (ages 12 mo-12 yrs)	SC	Anterolateral Thigh or Lateral Upper Arm	5/8" 23-25 g	Anaphylactic reaction to a prior dose or component (neomycin or gelatin); pregnancy
Inactivated Influenza (TIV)	6 months and older; brand to use based on age	IM	Anterolateral Thigh or Deltoid	1"-1.5" 22-25 g	Anaphylactic reaction to a prior dose or component (eggs)
Hepatitis A (Hep A)	1 st dose at/after 12 mo 2 nd dose 6 mo later	IM	Anterolateral Thigh or Deltoid	1"-1.5" 22-25 g	Anaphylactic reaction to prior dose or component; hypersensitivity to alum (Havrix®: 2-phenoxyethanol)

☐ Vaccines should never be administered in the buttocks.

⊕ See package insert for complete contraindication/component listing; may vary by brand *

Professional judgment is appropriate when selecting needle length for use in all children, especially small infants or larger children.

± Use of the deltoid muscle in children 18 months and older (if adequate muscle mass is present) is an option for IM injections. December 11, 2007

Injectable Vaccine Administration for Children 7-18 Years

Vaccine	Age/Reminders	Route	Site*	Needle*	Contraindications ⊕
Tetanus, diphtheria (Td)	7 years and older	IM	Deltoid	1"-1.5" 22-25 g	Anaphylactic reaction to prior dose or component
Tetanus, diphtheria, pertussis (Tdap)	Routinely given at age 11-12 years; one dose ■	IM	Deltoid	1"-1.5" 22-25 g	Anaphylactic reaction to prior dose or component; encephalopathy within 7 days of previous pertussis vaccine without other known cause
Hepatitis B (hep B)	1 st dose at birth; last dose at/after 6 mo	IM	Deltoid	1"-1.5" 22-25 g	Anaphylactic reaction to a prior dose or component (baker's yeast)
Inactivated Polio Vaccine (IPV)	For school entry: 1 st dose at/after 6 wks of age; all doses spaced at least 4 weeks apart	SC	Lateral Upper Arm	5/8" 23-25 g	Anaphylactic reaction to a prior dose or component (neomycin, streptomycin, or polymyxin B)
		IM	Deltoid	1"-1.5" 22-25 g	
Measles, Mumps, Rubella (MMR)	1 st dose at/after 12 mo	SC	Lateral Upper Arm	5/8" 23-25 g	Anaphylactic reaction to a prior dose or component (neomycin, gelatin); pregnancy
Varicella (Var)	1 st dose at/after 12 mo 12mo-12 yr: 3 months between dose 1 & 2	SC	Lateral Upper Arm	5/8" 23-25 g	Anaphylactic reaction to a prior dose or component (neomycin, gelatin); pregnancy
Inactivated Influenza (TIV)	Assure vaccine brand being used is age-appropriate	IM	Deltoid	1"-1.5" 22-25 g	Anaphylactic reaction to a prior dose or component (eggs)
Meningococcal Conjugate (MCV4)	Routinely given at age 11-12 yrs; catch-up all adolescents 13-18 yrs	IM	Deltoid	1"-1.5" 22-25 g	Anaphylactic reaction to a prior dose or component; history of GBS
Human Papilloma-virus (HPV4)	Females 9 through 26 years	IM	Deltoid	1"-1.5" 22-25 g	Anaphylactic reaction to prior dose or component; hypersensitivity to baker's yeast
Hepatitis A (hep A)	1 st dose at/after 12 mo 2 nd dose 6 mo later	IM	Deltoid	1"-1.5" 22-25 g	Anaphylactic reaction to prior dose or component; hypersensitivity to alum (Havrix®: 2-phenoxyethanol)

* Professional judgment is appropriate when selecting needle length and administration site; do not administer vaccines in buttocks

⊕ See package insert for complete contraindication listing; components may vary by brand of vaccine used

■ Two Tdap vaccines available: Boostrix® (GSK) is licensed for persons 10-18 yrs; ADACEL™ (sanofi pasteur) licensed for persons 11-64 yrs.

HEPATITIS B VACCINE

WHAT YOU NEED TO KNOW

1 What is hepatitis B?

Hepatitis B is a serious disease that affects the liver. It is caused by the hepatitis B virus (HBV). HBV can cause:

Acute (short-term) illness. This can lead to:

- loss of appetite
- diarrhea and vomiting
- tiredness
- jaundice (yellow skin or eyes)
- pain in muscles, joints, and stomach

Acute illness is more common among adults. Children who become infected usually do not have acute illness.

Chronic (long-term) infection. Some people go on to develop chronic HBV infection. This can be very serious, and often leads to:

- liver damage (cirrhosis)
- liver cancer
- death

Chronic infection is more common among infants and children than among adults. People who are infected can spread HBV to others, even if they don't appear sick.

- In 2005, about 51,000 people became infected with hepatitis B.
- About 1.25 million people in the United States have chronic HBV infection.
- Each year about 3,000 to 5,000 people die from cirrhosis or liver cancer caused by HBV.

Hepatitis B virus is spread through contact with the blood or other body fluids of an infected person. A person can become infected by:

- contact with a mother's blood and body fluids at the time of birth;
- contact with blood and body fluids through breaks in the skin such as bites, cuts, or sores;
- contact with objects that could have blood or body fluids on them such as toothbrushes or razors;
- having unprotected sex with an infected person;
- sharing needles when injecting drugs;
- being stuck with a used needle on the job.

2 Hepatitis B vaccine: Why get vaccinated?

Hepatitis B vaccine can prevent hepatitis B, and the serious consequences of HBV infection, including liver cancer and cirrhosis.

Routine hepatitis B vaccination of U.S. children began in 1991. Since then, the reported incidence of acute hepatitis B among children and adolescents has dropped by more than 95% – and by 75% in all age groups.

Hepatitis B vaccine is made from a part of the hepatitis B virus. It cannot cause HBV infection.

Hepatitis B vaccine is usually given as a **series of 3 or 4 shots**. This vaccine series gives long-term protection from HBV infection, possibly lifelong.

3 Who should get hepatitis B vaccine and when?

Children and Adolescents

- All children should get their first dose of hepatitis B vaccine **at birth** and should have completed the vaccine series by 6-18 months of age.
- Children and adolescents through 18 years of age who did not get the vaccine when they were younger should also be vaccinated.

Adults

- All unvaccinated adults **at risk for HBV infection** should be vaccinated. This includes:
 - sex partners of people infected with HBV,
 - men who have sex with men,
 - people who inject street drugs,
 - people with more than one sex partner,
 - people with chronic liver or kidney disease,
 - people with jobs that expose them to human blood,
 - household contacts of people infected with HBV,
 - residents and staff in institutions for the developmentally disabled,
 - kidney dialysis patients,

- people who travel to countries where hepatitis B is common,
- people with HIV infection.

- Anyone else who wants to be protected from HBV infection may be vaccinated.

4 Who should NOT get hepatitis B vaccine?

- Anyone with a life-threatening allergy to **baker's yeast**, or to **any other component of the vaccine**, should not get hepatitis B vaccine. Tell your provider if you have any severe allergies.
- Anyone who has had a life-threatening allergic reaction to a **previous dose of hepatitis B vaccine** should not get another dose.
- Anyone who is **moderately or severely ill** when a dose of vaccine is scheduled should probably wait until they recover before getting the vaccine.

Your provider can give you more information about these precautions.

Pregnant women who need protection from HBV infection may be vaccinated.

5 Hepatitis B vaccine risks

Hepatitis B is a very safe vaccine. Most people do not have any problems with it.

The following **mild problems** have been reported:

- Soreness where the shot was given (up to about 1 person in 4).
- Temperature of 99.9°F or higher (up to about 1 person in 15).

Severe problems are extremely rare. Severe allergic reactions are believed to occur about once in 1.1 million doses.

A vaccine, like any medicine, *could* cause a serious reaction. But the risk of a vaccine causing serious harm, or death, is extremely small. More than 100 million people have gotten hepatitis B vaccine in the United States.

6 What if there is a moderate or severe reaction?

What should I look for?

- Any unusual condition, such as a high fever or behavior changes. Signs of a serious allergic

DCH-0450

reaction can include difficulty breathing, hoarseness or wheezing, hives, paleness, weakness, a fast heart beat or dizziness.

What should I do?

- **Call a doctor**, or get the person to a doctor right away.
- **Tell your doctor** what happened, the date and time it happened, and when the vaccination was given.
- **Ask your doctor, nurse, or health department** to report the reaction by filing a Vaccine Adverse Event Reporting System (VAERS) form.

Or you can file this report through the VAERS web site at www.vaers.hhs.gov, or by calling 1-800-822-7967.

VAERS does not provide medical advice.

7 The National Vaccine Injury Compensation Program

In the event that you or your child has a serious reaction to a vaccine, a federal program has been created to help pay for the care of those who have been harmed.

For details about the National Vaccine Injury Compensation Program, call 1-800-338-2382 or visit their website at www.hrsa.gov/vaccinecompensation.

8 How can I learn more?

- Ask your doctor or nurse. They can give you the vaccine package insert or suggest other sources of information.
- Call your local or state health department.
1-888-767-4687
- Contact the Centers for Disease Control and Prevention (CDC):
 - Call 1-800-232-4636 (1-800-CDC-INFO)
 - Visit CDC websites at:
www.cdc.gov/ncidod/diseases/hepatitis
www.cdc.gov/vaccines
www.cdc.gov/travel

DEPARTMENT OF HEALTH AND HUMAN SERVICES
CENTERS FOR DISEASE CONTROL AND PREVENTION

Vaccine Information Statement (Interim)
Hepatitis B (7/18/07) 42 U.S.C. § 300aa-26

AUTH: P.H.S., Act 42, Sect. 2126.

To allow medical care provider(s) accurate immunization status information, an immunization assessment, and a recommended schedule for future immunizations, information will be sent to the Michigan Care Improvement Registry. Individuals have the right to request that their medical care provider not forward immunization information to the Registry.

Important Vaccine Information Statement (VIS) Facts

VIS now posted on MDCH website

The English language Vaccine Information Statements (VIS) are now posted on our website. We are also in the process of posting the foreign language VIS.

In Michigan, it is important that vaccine recipients, their parents, or their legal representatives be given the Michigan version of the VIS because they include information about the Michigan Care Improvement Registry (MCIR). By state law, parents must be informed about MCIR. Vaccine Information Statements that are obtained from other sources (e.g., from the CDC or IAC websites) do not contain information about MCIR.

www.michigan.gov/immunize

Foreign Languages

The VIS are available in 36 foreign languages. They include information about MCIR. When the foreign language VIS is not the most current version, parents should also be given the current English version. To receive the VIS in a foreign language, call the MDCH Division of Immunization at 517-335-8159.

We are currently in the process of posting the foreign language VIS on the MDCH website. The foreign language VIS will be posted at www.michigan.gov/immunize.

VIS documentation procedures

By noting the version date of the VIS on the patient's vaccine administration record, the provider is indicating that the parent and/or patient received the most current information about the vaccine. To document this, the provider must note in the patient's medical record the date the VIS was given and the version date of the VIS.

Tetanus/Diphtheria/Pertussis
Human Papillomavirus

Hepatitis A
Hepatitis B
Measles/Mumps/Rubella
Varicella (chickenpox)
Meningococcal
Zoster (shingles)

Sometimes the immunizations that protect you from serious diseases may also cause some discomfort. Reactions to vaccinations do occur, but serious reactions are rare. The more common reactions are redness, slight swelling and pain at the injection site and fever.

- If your arm becomes sore, you may want to apply ice or a cold pack to the injection area for 5–10 minutes at a time.
- Using or exercising the arm where the injection was given will distribute the medication quickly and decrease soreness.
- If you develop a fever greater than 100°F (38°C)
 - Please take a fever reducing medication as directed: _____ for the next 24 hours.
 - Drink plenty of fluids.
 - Dress lightly.

If you have other questions or are concerned about how you are feeling, **CALL** the clinic!

How to complete the administration record for:

- Single Vaccines
- Combination Vaccines (ie. DTAP-HepB-IPV)
- Vaccines that are given elsewhere and
- History of Chickenpox Disease

¹ Place an asterisk (*) next to the date the vaccine was given to indicate vaccines administered elsewhere.

² Site Code: LA=LT ARM, RA=RT ARM, LL=LT LEG, RL=RT LEG

³ Route Code: IM= intramuscular, SC=subcutaneous, IN=intranasal, PO=oral

⁴ Client Status: M=Medicaid, U=Uninsured, D=Underinsured, P=Private Insurance, A=American Indian or Alaskan Native, V=MIVRP, L=Other Public Purchase

Documenting Immunizations- What You Need To Know

The National Childhood Vaccine Injury Act (NCVIA) requires all health care providers in the United States who administer any vaccine containing diphtheria, tetanus, pertussis, measles, mumps, rubella, polio, hepatitis B, Hib, pneumococcal conjugate, influenza, rotavirus and varicella antigen to document the information detailed below:

Vaccine Administration Record For Children and Teens

Patient Name _____

Date of Birth _____

MCIR ID# _____

Clinic Name/Address

Vaccine	Date ¹ Vaccine & Vaccine Information Statement Given	Type of Vaccine	Date on Vaccine Information Statement (VIS) ²	Vaccine Manf. ³	Vaccine Lot Number	Site ² Given	Route ³	Signature of Vaccine Administrator	Client VFC Status ⁴
Diphtheria, Tetanus, Pertussis Types are: DTaP DT DTaP-Hib DTaP-HepB-IPV Td Tdap									

1 The date the vaccine is administered and the date the Vaccine Information Statement (VIS) was given must be charted. Combination vaccines should be recorded under EACH of the antigens in the vaccine. If the vaccine was administered elsewhere, add an asterisk after the administration date.

2 Federal law requires the health care provider to provide a copy of the most current version of the appropriate Vaccine Information Statement (VIS). VIS are updated when there are changes in the information. By noting the version date of the VIS in the patient's medical record, the provider is indicating that the patient or parent has received the most current information about the vaccine. For combination vaccines (except MMR and DTaP), a VIS for each antigen in the vaccine must be provided and documented. In Michigan, it is important to use VIS that includes information about the Michigan Care Improvement Registry (MCIR). These VIS are available free from your local health department or at www.michigan.gov/immunize

The version date is located on the back of the VIS, towards the bottom.

U.S. DEPARTMENT OF HEALTH & HUMAN SERVICES
Centers for Disease Control and Prevention
National Immunization Program

Vaccine Information Statement
Hepatitis A (3/21/06) 42 U.S.C. § 300aa-26

Vaccines not administered due to true contraindications, supply, or parental refusal should be noted. A sample *Refusal to Consent to Vaccinations* form may be found in this section of the AIM Kit.

3 The lot number of the vaccine used and the manufacturer name must be documented for each immunization administered. This information will be needed in the case of an adverse event or vaccine recall.

4 The name and title of the person who administered the vaccine must be charted. The clinic name and address should also be documented on the record.

Note:

Patients/parents should be informed about the risks and benefits associated with immunizations including those associated with the vaccine-preventable disease. Federal and state guidelines do not require a parent/patient signature to administer vaccines. However, health care providers have the option to obtain a signature. Check with your agency for specific requirements.

I have been given a copy and have read, or have had explained to me, the information contained on the appropriate Vaccine Information Statement (VIS) about the disease(s) and the vaccine(s) which are to be administered today. I have had a chance to ask questions that were answered to my satisfaction. I understand the benefits and risks of the specific vaccine(s) and I ask that the vaccine(s) I have requested be given to me, or to the person named, for whom I am authorized to make this request.

Advice for Parents

Parents face many issues while raising their children, but having a child with the hepatitis B virus (HBV) presents new challenges.

Avoid the spread of HBV

- All parents, siblings and other household members need hepatitis B (hepB) vaccine.
- Extended family members, childcare providers, family, friends and others that have frequent and close contact with an infected child should consider hepB vaccination.

Know the facts

- Give clear and simple facts about hepatitis B:
 - It is spread through blood and infected body fluids.
 - It can be spread through bites or open wounds.
 - It cannot be spread by sharing toys, sneezing, coughing, spitting, or hugging.
 - There is a safe and effective vaccine to protect you.

Telling others

- Consider if your child is at high or low risk for exposing others to his or her blood or body fluids (e.g., consider age, frequency of accidents, nosebleeds, biting, frequent or occasional contact).
- More and more children are now getting vaccinated against HBV, so the risk of your child infecting others is reduced.
- Use common sense in deciding whom to tell about your child's HBV. Once you tell someone, you cannot take it back!

Practice Universal Precautions

- Blood and body fluids should be treated as if they are potentially infectious.
- Clean all spills with a diluted solution of bleach (one part bleach and ten parts water).
- Properly dispose of items used to clean spills.
- Properly dispose of items such as tissues, menstrual pads and tampons, band-aids, and wound dressings so others don't come into contact with any blood or body fluids.
- Wash your hands thoroughly with soap and warm water.

Information for People with Chronic Hepatitis B Infection

How to Take Care of Yourself and Others

People with chronic hepatitis B virus (HBV) infection (having HBV for more than six months) are known as carriers. Carriers who get HBV at a young age have an increased risk of liver disease as adults. Most HBV carriers do not feel or look sick, but still need to see their doctor at least once a year for follow-up care.

Carriers may feel healthy, but they can still give HBV to others. Carriers must protect others from their blood, or other body fluids such as semen and vaginal fluids. HBV is not spread by sneezing, coughing, or by casual contact such as holding hands or hugging.

What you can do to take care of yourself

- See your doctor for a check-up at least once a year
- Review all medications (prescription, over-the-counter, and alternative) with your doctor
- Discuss with your doctor about getting periodic ultrasounds, alpha-fetoprotein (AFP) blood tests, or other studies to make sure there is no evidence of a developing liver cancer
- Don't drink alcohol because it can further damage your liver, especially when used with acetaminophen (an ingredient found in cold and headache remedies)
- Don't eat raw oysters
- Get the hepatitis A vaccinations and all other immunizations that may be needed

What you can do to protect others

- If you are pregnant, tell your doctor that you have HBV so your baby can get the hepatitis B (hepB) vaccine and hepatitis B immune globulin (HBIG) at birth
- Cover all cuts and open sores
- Properly dispose of all items such as tissues, menstrual pads and tampons, so others don't come into contact with any blood or body fluids
- Wash hands well after touching your blood or body fluids
- Clean up blood spills with one part bleach to ten parts water
- Make sure all household and sexual partners are tested and treated
- Tell your sexual partner(s) that you have HBV and continue to use a latex condom until they have had a blood test and are fully vaccinated, if needed
- Let your doctor and dentist know that you have HBV
- Do **NOT** share food or gum that has been in your mouth
- Do **NOT** share toothbrushes, razors, tattooing and body piercing equipment, earrings, nail files, clippers, or anything that may have come into contact with your blood or body fluids
- Do **NOT** share syringes or needles
- Do **NOT** donate blood, plasma, body organs, tissue, sperm or eggs

Free immunization brochures and materials order form

Submit your order at www.healthymichigan.com

You may also fax this order form to (517) 699-2376. For information about orders that have already been placed, call the Michigan Department of Community Health (MDCH) Clearinghouse toll-free at (888) 76-SHOTS. Other questions should be directed to the MDCH Division of Immunization (517) 335-8159.

Please enter quantity for each requested item. (Orders for brochures are usually limited to 500, unless otherwise stated. Limits on orders may be temporarily decreased if inventory is low.)

Quantity needed	Item requested
(Limit 1)	2008 Alliance for Immunization in Michigan (AIM) Provider Tool Kit – (Updated annually) This packet is designed for health care professionals who administer vaccines to their patients. Immunization schedules for children, adolescents and adults are included, along with information about contraindications, administration, documentation, and storage and handling of vaccines.
The AIM Provider Tool Kit is now online: www.aimtoolkit.org	
(Limit 250)	The Individual Immunization Record card has replaced the Adult Immunization Record card. The new card is used for children, adolescents and adults in Michigan. The limit for orders placed through the MDCH Clearinghouse is 250. Hospitals and local health departments: Please place your orders directly with the Michigan Department of Community Health's Division of Immunization by calling (517) 335-8159.
(Limit 50)	Influenza Vaccination Pocket Guide – (the pocket guides are for health care providers only)
(Limit 50)	Pneumococcal Polysaccharide (PPV23) Vaccination Pocket Guide – (for health care providers)
Quantity needed	Brochures
	Protect Babies and Toddlers from Serious Diseases
	Keep Your Family Safe from the Flu
	If you have Diabetes, Getting a Flu Shot is a Family Affair
	Shots for your Child (about the Vaccines for Children program)

Quantity needed	Brochures
	Protect Pre-Teens and Teens from Serious Diseases (This brochure will be available in June 2008. This is a new brochure that replaces an older brochure for teens called "Are you 11-19 Years Old? Teens and Immunizations.")
	Adult Immunizations: Are you protected?
	Hepatitis B: What Parents Need to Know (With special information for pregnant women)
	The Dangers of Hepatitis B: What they are, How to avoid them
	Hepatitis, What you need to know (ABCs)
	Childhood Immunizations: Vaccine Safety (This brochure will be available in June 2008. This is a new brochure that replaces an older brochure called "Vaccine Safety.")
	Antibiotics: What You Should Know

To order:

- Submit your order at www.healthymichigan.com
- This form may also be faxed to the MDCH Clearinghouse at (517) 699-2376

Influenza ⁶						Influenza (Yearly)							
Measles, Mumps, Rubella ⁷						MMR						MMR	
Varicella ⁸						Varicella						Varicella	
Hepatitis A ⁹						HepA (2 doses)					HepA Series		
Meningococcal ¹⁰											MCV4		

This schedule indicates the recommended ages for routine administration of currently licensed childhood vaccines, as of December 1, 2007, for children aged 0 through 6 years. Additional information is available at www.cdc.gov/vaccines/recs/schedules. Any dose not administered at the recommended age should be administered at any subsequent visit, when indicated and feasible. Additional vaccines may be licensed and recommended during the year. Licensed combination vaccines may be used whenever any components of the combination are indicated and other components of the vaccine are not

contraindicated and if approved by the Food and Drug Administration for that dose of the series. Providers should consult the respective Advisory Committee on Immunization Practices statement for detailed recommendations, including for **high-risk conditions**: <http://www.cdc.gov/vaccines/pubs/ACIP-list.htm>. Clinically significant adverse events that follow immunization should be reported to the Vaccine Adverse Event Reporting System (VAERS). Guidance about how to obtain and complete a VAERS form is available at www.vaers.hhs.gov or by telephone, **800-822-7967**.

1. Hepatitis B vaccine (HepB). (Minimum age: birth)

At birth:

- Administer monovalent HepB to all newborns prior to hospital discharge.
- If mother is hepatitis B surface antigen (HBsAg) positive, administer HepB and 0.5 mL of hepatitis B immune globulin (HBIG) within 12 hours of birth.
- If mother's HBsAg status is unknown, administer HepB within 12 hours of birth. Determine the HBsAg status as soon as possible and if HBsAg positive, administer HBIG (no later than age 1 week).
- If mother is HBsAg negative, the birth dose can be delayed, in rare cases, with a provider's order and a copy of the mother's negative HBsAg laboratory report in the infant's medical record.

After the birth dose:

- The HepB series should be completed with either monovalent HepB or a combination vaccine containing HepB. The second dose should be administered at age 1–2 months. The final dose should be administered no earlier than age 24 weeks. Infants born to HBsAg-positive mothers should be tested for HBsAg and antibody to HBsAg after completion of at least 3 doses of a licensed HepB series, at age 9–18 months (generally at the next well-child visit).

4-month dose:

- It is permissible to administer 4 doses of HepB when combination vaccines are administered after the birth dose. If monovalent HepB is used for doses after the birth dose, a dose at age 4 months is not needed.

2. Rotavirus vaccine (Rota). (Minimum age: 6 weeks)

- Administer the first dose at age 6–12 weeks.
- Do not start the series later than age 12 weeks.
- Administer the final dose in the series by age 32 weeks. Do not administer any dose later than age 32 weeks.
- Data on safety and efficacy outside of these age ranges are insufficient.

3. Diphtheria and tetanus toxoids and acellular pertussis vaccine (DTaP). (Minimum age: 6 weeks)

- The fourth dose of DTaP may be administered as early as age 12 months, provided 6 months have elapsed since the third dose.
- Administer the final dose in the series at age 4–6 years.

4. Haemophilus influenzae type b conjugate vaccine (Hib). (Minimum age: 6 weeks)

- If PRP-OMP (PedvaxHIB® or ComVax® [Merck]) is administered at ages 2 and 4 months, a dose at age 6 months is not required.
- TriHibit® (DTaP/Hib) combination products should not be used for primary immunization but can be used as boosters following any Hib vaccine in children age 12 months or older.

5. Pneumococcal vaccine. (Minimum age: 6 weeks for pneumococcal conjugate vaccine [PCV]; 2 years for pneumococcal polysaccharide vaccine [PPV])

- Administer one dose of PCV to all healthy children aged 24–59 months having any incomplete schedule.
- Administer PPV to children aged 2 years and older with underlying medical conditions.

6. Influenza vaccine. (Minimum age: 6 months for trivalent inactivated influenza vaccine [TIV]; 2 years for live, attenuated influenza vaccine [LAIV])

- Administer annually to children aged 6–59 months and to all eligible close contacts of children aged 0–59 months.
- Administer annually to children 5 years of age and older with certain risk factors, to other persons (including household members) in close contact with persons in groups at higher risk, and to any child whose parents request vaccination.
- For healthy persons (those who do not have underlying medical conditions that predispose them to influenza complications) ages 2–49 years, either LAIV or TIV may be used.
- Children receiving TIV should receive 0.25 mL if age 6–35 months or 0.5 mL if age 3 years or older.
- Administer 2 doses (separated by 4 weeks or longer) to children younger than 9 years who are receiving influenza vaccine for the first time or who were vaccinated for the first time last season but only received one dose.

7. Measles, mumps, and rubella vaccine (MMR). (Minimum age: 12 months)

- Administer the second dose of MMR at age 4–6 years. MMR may be administered before age 4–6 years, provided 4 weeks or more have elapsed since the first dose.

8. Varicella vaccine. (Minimum age: 12 months)

- Administer second dose at age 4–6 years; may be administered 3 months or more after first dose.
- Do not repeat second dose if administered 28 days or more after first dose.

9. Hepatitis A vaccine (HepA). (Minimum age: 12 months)

- Administer to all children aged 1 year (i.e., aged 12–23 months). Administer the 2 doses in the series at least 6 months apart.
- Children not fully vaccinated by age 2 years can be vaccinated at subsequent visits.
- HepA is recommended for certain other groups of children, including in areas where vaccination programs target older children.

10. Meningococcal vaccine. (Minimum age: 2 years for meningococcal conjugate vaccine [MCV4] and for meningococcal polysaccharide vaccine [MPSV4])

- Administer MCV4 to children aged 2–10 years with terminal complement deficiencies or anatomic or functional asplenia and certain other high-risk groups. MPSV4 is also acceptable.
- Administer MCV4 to persons who received MPSV4 3 or more years previously and remain at increased risk for meningococcal disease.

Recommended Immunization Schedule for Persons Aged 7–18 Years—UNITED STATES • 2008

For those who fall behind or start late, see the green bars and the catch-up schedule

Additional information is available at www.cdc.gov/vaccines/recs/schedules. Any dose not administered at the recommended age should be administered at any subsequent visit, when indicated and feasible. Additional vaccines may be licensed and recommended during the year. Licensed combination vaccines may be used whenever any components of the combination are indicated and other components of the vaccine are not

contraindicated and if approved by the Food and Drug Administration for that dose of the series. Providers should consult the respective Advisory Committee on Immunization Practices statement for detailed recommendations, including for **high risk conditions**: <http://www.cdc.gov/vaccines/pubs/ACIP-list.htm>. Clinically significant adverse events that follow immunization should be reported to the Vaccine Adverse Event Reporting System (VAERS). Guidance about how to obtain and complete a VAERS form is available at www.vaers.hhs.gov or by telephone, **800-822-7967**.

1. Tetanus and diphtheria toxoids and acellular pertussis vaccine (Tdap). (Minimum age: 10 years for BOOSTRIX® and 11 years for ADACEL™)

- Administer at age 11–12 years for those who have completed the recommended childhood DTP/DTaP vaccination series and have not received a tetanus and diphtheria toxoids (Td) booster dose.
- 13–18-year-olds who missed the 11–12 year Tdap or received Td only are encouraged to receive one dose of Tdap 5 years after the last Td/DTaP dose.

2. Human papillomavirus vaccine (HPV). (Minimum age: 9 years)

- Administer the first dose of the HPV vaccine series to females at age 11–12 years.
- Administer the second dose 2 months after the first dose and the third dose 6 months after the first dose.
- Administer the HPV vaccine series to females at age 13–18 years if not previously vaccinated.

3. Meningococcal vaccine.

- Administer MCV4 at age 11–12 years and at age 13–18 years if not previously vaccinated. MPSV4 is an acceptable alternative.
- Administer MCV4 to previously unvaccinated college freshmen living in dormitories.
- MCV4 is recommended for children aged 2–10 years with terminal complement deficiencies or anatomic or functional asplenia and certain other high-risk groups.
- Persons who received MPSV4 3 or more years previously and remain at increased risk for meningococcal disease should be vaccinated with MCV4.

4. Pneumococcal polysaccharide vaccine (PPV).

- Administer PPV to certain high-risk groups.

5. Influenza vaccine.

- Administer annually to all close contacts of children aged 0–59 months.
- Administer annually to persons with certain risk factors, health-care workers, and other persons (including household members) in close contact with persons in groups at higher risk.

- Administer 2 doses (separated by 4 weeks or longer) to children younger than 9 years who are receiving influenza vaccine for the first time or who were vaccinated for the first time last season but only received one dose.
- For healthy nonpregnant persons (those who do not have underlying medical conditions that predispose them to influenza complications) ages 2–49 years, either LAIV or TIV may be used.

6. Hepatitis A vaccine (HepA).

- Administer the 2 doses in the series at least 6 months apart.
- HepA is recommended for certain other groups of children, including in areas where vaccination programs target older children.

7. Hepatitis B vaccine (HepB).

- Administer the 3-dose series to those who were not previously vaccinated.
- A 2-dose series of Recombivax HB® is licensed for children aged 11–15 years.

8. Inactivated poliovirus vaccine (IPV).

- For children who received an all-IPV or all-oral poliovirus (OPV) series, a fourth dose is not necessary if the third dose was administered at age 4 years or older.
- If both OPV and IPV were administered as part of a series, a total of 4 doses should be administered, regardless of the child's current age.

9. Measles, mumps, and rubella vaccine (MMR).

- If not previously vaccinated, administer 2 doses of MMR during any visit, with 4 or more weeks between the doses.

10. Varicella vaccine.

- Administer 2 doses of varicella vaccine to persons younger than 13 years of age at least 3 months apart. Do not repeat the second dose if administered 28 or more days following the first dose.
- Administer 2 doses of varicella vaccine to persons aged 13 years or older at least 4 weeks apart.

The Recommended Immunization Schedules for Persons Aged 0–18 Years are approved by the Advisory Committee on Immunization Practices (www.cdc.gov/vaccines/recs/acip), the American Academy of Pediatrics (<http://www.aap.org>), and the American Academy of Family Physicians (<http://www.aafp.org>).

Catch-up Immunization Schedule

UNITED STATES • 2008

for Persons Aged 4 Months–18 Years Who Start Late or Who Are More Than 1 Month Behind

The table below provides catch-up schedules and minimum intervals between doses for children whose vaccinations have been delayed. A vaccine series does not need to be restarted, regardless of the time that has elapsed between doses. Use the section appropriate for the child's age.

CATCH-UP SCHEDULE FOR PERSONS AGED 4 MONTHS–6 YEARS					
Vaccine	Minimum Age for Dose 1	Minimum Interval Between Doses			
		Dose 1 to Dose 2	Dose 2 to Dose 3	Dose 3 to Dose 4	Dose 4 to Dose 5
Hepatitis B ¹	Birth	4 weeks	8 weeks (and 16 weeks after first dose)		
Rotavirus ²	6 wks	4 weeks	4 weeks		
Diphtheria, Tetanus, Pertussis ³	6 wks	4 weeks	4 weeks	6 months	6 months ³
<i>Haemophilus influenzae</i> type b ⁴	6 wks	4 weeks if first dose administered at younger than 12 months of age 8 weeks (as final dose) if first dose administered at age 12–14 months No further doses needed if first dose administered at 15 months of age or older	4 weeks ⁴ if current age is younger than 12 months 8 weeks (as final dose) ⁴ if current age is 12 months or older and second dose administered at younger than 15 months of age No further doses needed if previous dose administered at age 15 months or older	8 weeks (as final dose) This dose only necessary for children aged 12 months–5 years who received 3 doses before age 12 months	
Pneumococcal ⁵	6 wks	4 weeks if first dose administered at younger than 12 months of age 8 weeks (as final dose) if first dose administered at age 12 months or older or current age 24–59 months No further doses needed for healthy children if first dose administered at age 24 months or older	4 weeks if current age is younger than 12 months 8 weeks (as final dose) if current age is 12 months or older No further doses needed for healthy children if previous dose administered at age 24 months or older	8 weeks (as final dose) This dose only necessary for children aged 12 months–5 years who received 3 doses before age 12 months	
Inactivated Poliovirus ⁶	6 wks	4 weeks	4 weeks	4 weeks ⁶	
Measles, Mumps, Rubella ⁷	12 mos	4 weeks			
Varicella ⁸	12 mos	3 months			
Hepatitis A ⁹	12 mos	6 months			
CATCH-UP SCHEDULE FOR PERSONS AGED 7–18 YEARS					
Tetanus, Diphtheria/ Tetanus, Diphtheria, Pertussis ¹⁰	7 yrs ¹⁰	4 weeks	4 weeks if first dose administered at younger than 12 months of age 6 months if first dose administered at age 12 months or older	6 months if first dose administered at younger than 12 months of age	
Human Papillomavirus ¹¹	9 yrs	4 weeks	12 weeks (and 24 weeks after the first dose)		
Hepatitis A ⁹	12 mos	6 months			
Hepatitis B ¹	Birth	4 weeks	8 weeks (and 16 weeks after first dose)		
Inactivated Poliovirus ⁶	6 wks	4 weeks	4 weeks	4 weeks ⁶	
Measles, Mumps, Rubella ⁷	12 mos	4 weeks			
Varicella ⁸	12 mos	4 weeks if first dose administered at age 13 years or older 3 months if first dose administered at younger than 13 years of age			

1. Hepatitis B vaccine (HepB).

- Administer the 3-dose series to those who were not previously vaccinated.
- A 2-dose series of Recombivax HB® is licensed for children aged 11–15 years.

2. Rotavirus vaccine (Rota).

- Do not start the series later than age 12 weeks.
- Administer the final dose in the series by age 32 weeks.
- Do not administer a dose later than age 32 weeks.
- Data on safety and efficacy outside of these age ranges are insufficient.

3. Diphtheria and tetanus toxoids and acellular pertussis vaccine (DTaP).

- The fifth dose is not necessary if the fourth dose was administered at age 4 years or older.
- DTaP is not indicated for persons aged 7 years or older.

4. *Haemophilus influenzae* type b conjugate vaccine (Hib).

- Vaccine is not generally recommended for children aged 5 years or older.
- If current age is younger than 12 months and the first 2 doses were PRP-OMP (PedvaxHIB® or ComVax® [Merck]), the third (and final) dose should be administered at age 12–15 months and at least 8 weeks after the second dose.
- If first dose was administered at age 7–11 months, administer 2 doses separated by 4 weeks plus a booster at age 12–15 months.

5. Pneumococcal conjugate vaccine (PCV).

- Administer one dose of PCV to all healthy children aged 24–59 months having any incomplete schedule.
- For children with underlying medical conditions, administer 2 doses of PCV at least 8 weeks apart if previously received less than 3 doses, or 1 dose of PCV if previously received 3 doses.

6. Inactivated poliovirus vaccine (IPV).

- For children who received an all-IPV or all-oral poliovirus (OPV) series, a fourth dose is not necessary if third dose was administered at age 4 years or older.

- If both OPV and IPV were administered as part of a series, a total of 4 doses should be administered, regardless of the child's current age.
- IPV is not routinely recommended for persons aged 18 years and older.

7. Measles, mumps, and rubella vaccine (MMR).

- The second dose of MMR is recommended routinely at age 4–6 years but may be administered earlier if desired.
- If not previously vaccinated, administer 2 doses of MMR during any visit with 4 or more weeks between the doses.

8. Varicella vaccine.

- The second dose of varicella vaccine is recommended routinely at age 4–6 years but may be administered earlier if desired.
- Do not repeat the second dose in persons younger than 13 years of age if administered 28 or more days after the first dose.

9. Hepatitis A vaccine (HepA).

- HepA is recommended for certain groups of children, including in areas where vaccination programs target older children. See *MMWR* 2006;55(No. RR-7):1–23.

10. Tetanus and diphtheria toxoids vaccine (Td) and tetanus and diphtheria toxoids and acellular pertussis vaccine (Tdap).

- Tdap should be substituted for a single dose of Td in the primary catch-up series or as a booster if age appropriate; use Td for other doses.
- A 5-year interval from the last Td dose is encouraged when Tdap is used as a booster dose. A booster (fourth) dose is needed if any of the previous doses were administered at younger than 12 months of age. Refer to ACIP recommendations for further information. See *MMWR* 2006;55(No. RR-3).

11. Human papillomavirus vaccine (HPV).

- Administer the HPV vaccine series to females at age 13–18 years if not previously vaccinated.

Information about reporting reactions after immunization is available online at <http://www.vaers.hhs.gov> or by telephone via the 24-hour national toll-free information line 800-822-7967.

Suspected cases of vaccine-preventable diseases should be reported to the state or local health department. Additional information, including precautions and contraindications for immunization, is available from the National Center for Immunization and Respiratory Diseases at <http://www.cdc.gov/vaccines> or telephone, 800-CDC-INFO (800-232-4636).

DEPARTMENT OF HEALTH AND HUMAN SERVICES • CENTERS FOR DISEASE CONTROL AND PREVENTION • SAFER • HEALTHIER • PEOPLE

Is the vaccine safe?

The hepB vaccine is very safe. The most common side effect is soreness at the place where the shot was given.

Before babies are given the hepB vaccine, their parents should be given a form called Hepatitis B Vaccine, What You Need To Know. This form gives information about the vaccine. Parents are asked to read the form and then talk with the doctor or nurse if they have questions.

Should older children get the hep B vaccine?

All children and teenagers should get the hepB vaccine. Parents can talk to their children's doctor or nurse about getting the vaccine.

Should anyone else get the shots?

People should get the hepB vaccine if they:

- live with someone who has the hepatitis B virus
- have more than one sexual partner
- have a sexually transmitted disease
- are a hemodialysis patient
- get blood products
- have liver disease
- come into contact with blood at their jobs
- inject drugs

HEPATITIS B: What Parents Need to Know

**With special information
for pregnant women**

What is hepatitis B?

Hepatitis B is a disease caused by a virus that infects the liver. People often show no signs of having the virus. Most people who get the virus get better in a few months, but some carry the virus in their blood all their lives (they are called carriers). In the United States, about 51,000 people get hepatitis B every year, and about one million people are carriers.

♥ **Babies can get hepatitis B at birth if their mother has the hepatitis B virus.**

♥ **Babies and young children may also get hepatitis B if they come into contact with blood or body fluids from their mother or from people they live with who have hepatitis B. The younger you are when you get hepatitis B, the more likely you will become a carrier of the disease.**

How do you get hepatitis B?

You can get it:

- ♥ **at birth, if your mother has the virus**
 - by having sex or sharing needles with someone who has the virus
 - by sharing personal things like razors and toothbrushes with a person who has the virus

One out of three people with the hepatitis B virus does not know how he or she got it.

How do you know if you have hepatitis B?

Hepatitis B can make you feel tired or sick and can sometimes make your skin and eyes yellow.

Many people don't know they have hepatitis B, because they don't feel or look sick. Even if you don't look or feel sick, you can still get liver disease and give hepatitis B to others.

The only way to know if you have hepatitis B is to get a blood test.

♥ **Women should be tested for hepatitis B surface antigen (HBsAg) during EACH pregnancy to see if they have the hepatitis B virus.**

How can babies be safe from getting hepatitis B?

♥ **If a test shows that a pregnant woman has the hepatitis B virus in her blood, her baby can get this virus at birth. Babies born to women who have the hepatitis B virus need:**

- hepatitis B immune globulin (HBIG) and hepatitis B (hepB) vaccine **WITHIN TWELVE HOURS OF BIRTH**
- a second shot of hepB vaccine at one to two months of age
- a third shot at six months of age
- a blood test three to nine months after the last shot to make sure that they are safe from getting the hepatitis B virus

Babies born to women who do NOT have the hepatitis B virus should also get the hepB vaccine:

- starting at birth
- at one to two months of age
- on or after six months of age

OFFICIAL IMMUNIZATION RECORD

For Children and Adults

Name: _____ Sex: ☐ F ☐ M

Birthdate: ____/____/____

Special Problems: _____

Physician/Clinic: _____

Name Telephone

Parent/Guardian: _____

Name Telephone

Getting immunized is a life-long job that prevents serious diseases.

- Children 11-12 years of age need shots to prevent tetanus, diphtheria, pertussis (whooping cough), and meningococcal disease. Girls should receive human papillomavirus vaccine.
- All adults (not just the elderly) need vaccines to protect them from severe illnesses.
- Many people need yearly influenza vaccine. Ask if you or one of your family members should get flu vaccine.

Keep track of the immunizations you and your child have received.

- Bring your immunization card to every medical visit. This is necessary for children and adults.
- Ask to have your card updated every time vaccines are given.
- The Michigan Care Improvement Registry (MCIR) keeps immunization records for Michigan residents. Ask if the vaccine you or your child received is entered in MCIR.*
- Children must meet Michigan's immunization requirements to enroll in any nursery, day care, preschool or head start program, and public or non-public school.

*"Under Public Act 540 of 1996 and the Administrative Rules [R325.163] which govern the immunizations given to children, a physician who administers immunizations to a child under the age of 20 years is required to report this information to the Michigan Care Improvement Registry (MCIR), formally the Michigan Childhood Immunization Registry."
